

PAZO

Demo Build — Developer Handoff

What to build, in what order, to get to a working demo

Version 1.0 — August 2026

Confidential — For developer use only

1. Context — What We Are Building

Pazo is a referral and partner commission platform. This document covers the demo build only — the minimum set of screens and features needed to demonstrate the platform to The Travela and future partners.

The Travela sells eSIM data bundles to tourists at thetravela.com. They need a referral system where hotels, tour operators, airlines, travel agencies, and individual agents refer tourists to their website and earn a commission on every purchase and top-up that tourist makes.

Pazo provides the infrastructure: partner accounts, referral codes, commission tracking, wallet management, and dashboards. The Travela handles the tourist-facing website and card payments entirely on their side. Pazo never touches the card payment.

What Pazo builds vs what The Travela builds

PAZO BUILDS: Partner dashboards (agent + institution), Business dashboard (The Travela), Admin dashboard, API endpoints for receiving webhooks

THE TRAVELA BUILDS: Referral link capture on their signup page, Payment webhook sent to Pazo after each confirmed payment

PAZO DOES NOT BUILD: Any tourist-facing screen, Any payment processing, Any card integration, Any POS system

2. The Three User Types for This Demo

User	Who They Are	What They Need to See	Login
Business (The Travela)	The Travela's operations team — manages the whole partner programme	Overview stats, partner list, referral activity, sales, commissions paid, wallet balance	Email + password
Agent (Individual)	A travel blogger, tour guide, or individual who refers tourists	Their referral code, QR code, referral link, earnings (no tourist names — just amounts and dates), payment history, linked mobile money number	Phone + OTP or email + password
Institution	A hotel, airline, tourism board, travel agency — an organisation referring tourists	Same as agent PLUS monthly payout schedule, accumulated balance, downloadable monthly statement	Email + password

User	Who They Are	What They Need to See	Login
Admin (Pazo)	Pazo's internal team — manages all users, monitors transactions, resolves issues	All businesses, all partners, all transactions, commission monitoring, wallet management	Email + password (separate admin login)

Privacy rule — applies to ALL dashboards

Tourist personal data (name, email, phone) is NEVER shown to agents or institutions.

Agent and institution dashboards show only: commission amount, transaction date, bundle type, and an anonymised reference ID.

Example notification: 'You earned TZS 2,467 on a Tanzania 7-Day bundle — 14 Aug 2026 at 10:42am'

The Travela business dashboard may show anonymised tourist IDs for their own records — no names.

3. Demo Scope — What to Build Now

This is the minimum viable demo. Build only what is listed here. Everything else comes later after the demo is validated with The Travela.

3.1 What IS in scope for the demo

- User authentication — login and signup for all three roles
- Agent dashboard — referral code, QR code, referral link, earnings, notification feed (no tourist names)
- Institution dashboard — same as agent plus monthly payout history and accumulated balance
- Business dashboard (The Travela) — overview stats, partner list, referral activity, wallet balance, commission summary
- Admin dashboard — user list, transaction list, commission monitor, basic platform stats
- One webhook endpoint — receives a payment notification from The Travela's system and calculates commission
- One API endpoint — validates a referral code (used when tourist signs up on The Travela)
- Basic notification system — in-app notification when a commission is received

3.2 What is NOT in scope for the demo

- Mobile app — web only for now
- POS transaction recording — The Travela handles all payments

- Content creation or portfolio features — agents are not content creators in this integration
- Chat between agents and The Travela — post-demo
- AzamPay integration — payouts are tracked but not processed in the demo (show as 'processing')
- Business subscription billing — free for now
- SMS notifications — in-app only for demo
- KYC document upload — post-demo
- Advanced analytics and exportable reports — post-demo
- CMS for public website — post-demo

4. Build Order — Exactly What to Do First

Follow this order strictly. Do not start the next phase until the current one is working and tested. The goal is a working demo as fast as possible, not a complete product.

Phase 1 — Project Setup (Day 1 morning)

Goal: A running project with database connected and first page loading

Est. time: 2–3 hours

1. Initialise the project. Recommended stack: Next.js (React) for the web app, Node.js + Express or Next.js API routes for the backend, PostgreSQL for the database. Use Tailwind CSS for styling — fastest to work with.
2. Set up the database with the core tables (see Section 6 for schema).
3. Create the login page — shared entry point. User enters email and password, system detects their role (business, agent, institution, admin) and redirects to the correct dashboard.
4. Create basic routing: /login, /dashboard/business, /dashboard/agent, /dashboard/institution, /admin
5. Confirm: you can log in with a seeded test user and reach a blank dashboard page.

Phase 2 — Agent Dashboard (Day 1 afternoon)

Goal: An agent can log in and see their referral code, QR, earnings, and notifications

Est. time: 3–4 hours

6. Build the agent dashboard layout: sidebar nav, top bar with agent name and profile photo.

7. Screen 1 — My Code: Display the agent's unique referral code in large text. Generate a QR code from their referral link (use a QR library e.g. 'qrcode' npm package). Add copy button for the link. Add share button (copies link to clipboard with a message).
8. Screen 2 — Earnings: Show total earned this month, total earned all time, and a list of recent commissions. Each item shows: amount in TZS, bundle type, date and time. No tourist name — use 'Anonymous customer' or just omit entirely.
9. Screen 3 — Notifications: A feed of in-app notifications. Each notification says: 'You earned TZS [X] on a [bundle name] — [date and time]'. Most recent at top.
10. Screen 4 — Settings: Agent's profile details, linked mobile money number (display only for now — edit post-demo).
11. Seed the database with one test agent account and dummy transaction history so the dashboard shows realistic data.

Phase 3 — Institution Dashboard (Day 2 morning)

Goal: An institution can log in and see everything an agent sees, plus monthly payout tracking

Est. time: 2–3 hours

12. The institution dashboard is almost identical to the agent dashboard. Reuse all agent screens.
13. Add one extra screen — Monthly Payouts: Shows a table of past monthly payouts with: month, total referrals that month, total sales generated, commission earned, payout status (paid / upcoming), payout date.
14. Change the earnings summary card: instead of 'Pay to mobile money', show 'Accumulated balance — paid on 1st of each month' with the next payout date.
15. Seed the database with one test institution account (e.g. 'Serena Hotel') with dummy monthly payout history.

Phase 4 — Business Dashboard (Day 2 afternoon)

Goal: The Travela can log in and see their full partner programme at a glance

Est. time: 4–5 hours

16. Build the business dashboard layout — wider, more data-dense than the agent view.
17. Screen 1 — Overview: Four stat cards at the top: total active partners, total referrals this month, total sales through referrals (TZS and USD), total commissions paid this month. Below: a simple bar chart of daily sales for the current month (use Recharts or Chart.js).
18. Screen 2 — Partners: A table of all partners (agents and institutions combined). Columns: partner name, type (Individual / Institution), referral code, referrals this month, sales generated, commission earned, payout method (Instant / Monthly), status (Active / Inactive). Clicking a row opens a partner detail panel.

19. Screen 3 — Referral Activity: A table of referral events. Each row: anonymised tourist ID, partner who referred them, date of signup, date of first purchase (if made), total purchases to date, total value.
20. Screen 4 — Wallet: Show the wallet balance as a prominent card. Below: a table of wallet transactions — each deduction (commission paid) and each top-up, with dates and amounts. Show a 'Low balance' warning if balance falls below a threshold.
21. Screen 5 — Commission History: Every commission paid out — partner name, amount, date, transaction reference, status.
22. Seed the database with The Travela as the business account, and link the test agent and institution accounts to it with realistic dummy data.

Phase 5 — Admin Dashboard (Day 3 morning)

Goal: Pazo team can log in and see all users and all transactions

Est. time: 3–4 hours

23. Build the admin layout — separate from the other dashboards, clearly labelled 'Pazo Admin'.
24. Screen 1 — Overview: Platform stats. Total businesses, total agents, total institutions, total transactions processed, total commissions paid, total platform fees earned.
25. Screen 2 — Businesses: List of all registered businesses. For each: name, date joined, total partners, total referrals, total commissions paid, wallet balance. Click to see full detail.
26. Screen 3 — Partners: List of all agents and institutions across all businesses. Name, type, business they belong to, total referrals, total earned, payout method, status.
27. Screen 4 — Transactions: Full list of all commission transactions. Filterable by: date range, partner, business, status. Each row: date, partner, business, amount, commission, status.
28. Screen 5 — Commission Monitor: Any pending or failed commissions. Ability to mark as resolved.

Phase 6 — API Endpoints (Day 3 afternoon)

Goal: Two working API endpoints that The Travela's developer can test against

Est. time: 2–3 hours

29. Endpoint 1 — Validate and register referral: POST /api/v1/referrals/register. Receives: referral_code, tourist_id. Validates the code exists and is active. Links tourist_id to the partner. Returns: partner name and commission rate. This is called by The Travela's website when a tourist signs up with a referral link.
30. Endpoint 2 — Record a payment: POST /api/v1/transactions. Receives: tourist_id, amount_tzs, bundle_type, transaction_reference. Looks up the tourist's linked partner. Calculates commission. Deducts from business wallet. Credits partner. Returns: commission amount and status. This is called by The Travela's system after a card payment is confirmed.
31. Protect both endpoints with an API key sent in the Authorization header. Generate a test API key for The Travela's developer to use.

32. Add basic request logging so every API call is recorded with timestamp, payload, and response.

Phase 7 — Polish & Seed Data (Day 4)

Goal: Demo looks real, feels real, has believable data throughout

Est. time: 3–4 hours

33. Replace all placeholder text with realistic Tanzanian context: partner names (Serena Hotel, Kilimanjaro Airport, Tanzania Tourism Board, Amina Hassan), bundle names (Tanzania 7-Day 5GB, Tanzania 14-Day 15GB), amounts in TZS.
34. Ensure every dashboard has enough data to tell a story: at least 3 months of dummy transaction history, at least 5 partners for The Travela, at least 20 dummy commission transactions per agent.
35. Test the full demo flow: log in as agent → see code and earnings → log in as institution → see monthly payout → log in as The Travela → see all partners and commissions → log in as admin → see everything.
36. Fix any broken layouts or obvious visual issues. The demo does not need to be beautiful but it must look professional and trustworthy.
37. Write down the login credentials for all four demo accounts and keep them ready for the meeting.

5. Screen Reference — Every Screen the Demo Needs

This is the complete list of screens to build. Nothing more. If a screen is not on this list, do not build it for the demo.

Agent Dashboard

Role: agent role

My Code — Referral code, QR code, referral link with copy and share buttons

Earnings — Total earned this month + all time. List of commissions — amount, bundle, date. No tourist names.

Notifications — Feed of in-app notifications. 'You earned TZS X on a [bundle] — [date time]'

Settings — Agent name, email, linked mobile money number (display only)

Institution Dashboard

Role: institution role

My Code — Same as agent — referral code, QR code, referral link

Earnings — Same as agent but labelled 'Accumulated balance' — paid monthly not instantly

Monthly Payouts — Table: month, referrals, sales, commission, status (Paid / Upcoming), payout date

Notifications — Same as agent — commission notifications without tourist names

Settings — Institution name, contact person, payout account details (display only)

Business Dashboard (The Travela)

Role: business role

Overview — 4 stat cards (partners, referrals, sales, commissions). Daily sales bar chart.

Partners — Table of all partners — name, type, code, referrals, sales, commission, payout method, status

Referral Activity — Table of referral events — anonymised tourist ID, partner, signup date, first purchase date, total value

Wallet — Wallet balance card. Table of deductions and top-ups. Low balance warning.

Commission History — Every commission paid — partner, amount, date, reference, status

Admin Dashboard

Role: admin role

Overview — Platform stats — businesses, agents, institutions, transactions, commissions, fees

Businesses — All registered businesses — name, joined, partners, referrals, commissions, wallet

Partners — All agents and institutions — name, type, business, referrals, earned, status

Transactions — All commission transactions — filterable by date, partner, business, status

Commission Monitor — Pending or failed commissions with resolve action

Shared

Role: all roles

Login page — Single login page — email + password. Role detected server-side and redirected to correct dashboard.

Agent signup — Phone OTP or email. Name, account type (Agent or Institution), mobile money number.

6. Database Schema — Core Tables

Build these tables first. The entire demo runs on these six tables. Do not add more tables until these are working.

users

Column	Type	Notes
id	UUID	Primary key
email	String	Unique
phone	String	Optional — for OTP login
password_hash	String	bcrypt
role	Enum	'business', 'agent', 'institution', 'admin'
name	String	Display name
status	Enum	'active', 'suspended'
created_at	Timestamp	

partners

One row per agent or institution. Linked to the business they belong to.

Column	Type	Notes
id	UUID	Primary key
user_id	UUID	FK → users
business_id	UUID	FK → businesses — the business they are a partner of
partner_type	Enum	'agent' (individual) or 'institution'
referral_code	String	Unique. Auto-generated at registration. Uppercase, 6–8 chars.
mobile_money_number	String	For instant agent payouts
payout_account	String	For institution monthly payouts — bank or mobile money
commission_rate	Decimal	Inherited from business settings. Stored here for historical accuracy.
status	Enum	'active', 'inactive', 'suspended'
created_at	Timestamp	

businesses

One row per business (The Travela is the first). Later other businesses will be added.

Column	Type	Notes
id	UUID	Primary key
user_id	UUID	FK → users (the business owner account)
name	String	e.g. 'The Travela'
website	String	e.g. 'thetravela.com'
commission_rate	Decimal	Default rate for all partners — e.g. 0.08 for 8%
wallet_balance	Integer	TZS. Current pre-loaded balance.
wallet_alert_threshold	Integer	TZS. Send low-balance alert below this amount.
api_key	String	Hashed. Used by the business to authenticate API calls to Pazo.
status	Enum	'active', 'suspended'
created_at	Timestamp	

referrals

One row per tourist who signed up using a partner's referral code. Tourist personal data is NOT stored here — only their identifier from The Travela's system.

Column	Type	Notes
id	UUID	Primary key
partner_id	UUID	FK → partners
business_id	UUID	FK → businesses
tourist_external_id	String	The tourist's ID from The Travela's system. Opaque — not a name or email.
signup_date	Timestamp	When the referral was registered
first_purchase_date	Timestamp	Nullable — set when first transaction is received for this tourist
total_purchases	Integer	Running count
total_value_tzs	Integer	Running total of all purchase amounts
status	Enum	'referred', 'purchased', 'inactive'

transactions

One row per payment event received from The Travela's webhook. This is the core record of every commission.

Column	Type	Notes
id	UUID	Primary key
referral_id	UUID	FK → referrals
partner_id	UUID	FK → partners
business_id	UUID	FK → businesses
external_transaction_ref	String	The Travela's own payment reference — for reconciliation
bundle_type	String	e.g. 'Tanzania 7-Day 5GB'
transaction_type	Enum	'first_purchase' or 'topup'
amount_tzs	Integer	Full purchase amount
commission_tzs	Integer	Commission paid to partner
platform_fee_tzs	Integer	Fee retained by Pazo
commission_status	Enum	'paid', 'pending', 'failed'
paid_at	Timestamp	When commission was disbursed
created_at	Timestamp	When webhook was received

notifications

Column	Type	Notes
id	UUID	Primary key
user_id	UUID	FK → users — who sees this notification
type	Enum	'commission_paid', 'commission_pending', 'low_wallet_balance', 'partner_joined'
message	String	The notification text shown to the user
is_read	Boolean	Default false
created_at	Timestamp	

7. The Two API Endpoints to Build

Only two API endpoints are needed for the demo. Build these exactly as specified. The Travela's developer will integrate against these.

Endpoint 1 — Register a Referral

Item	Detail
Method & path	POST /api/v1/referrals/register
Auth	Authorization: Bearer {api_key} — matched against businesses.api_key
Request body	{ referral_code: string, tourist_id: string }
What it does	1. Validate the api_key → find the business. 2. Find the partner with this referral_code belonging to this business. 3. Check no existing referral for this tourist_id + business_id. 4. Create a new row in referrals table. 5. Return success with partner info.
Success 200	{ success: true, partner_id: string, partner_name: string, commission_rate: number }
Invalid code 404	{ success: false, error: 'Referral code not found or inactive' }
Duplicate 200	{ success: true, message: 'Tourist already registered — referral unchanged' }
Failed auth 401	{ success: false, error: 'Invalid API key' }

Endpoint 2 — Record a Payment

Item	Detail
Method & path	POST /api/v1/transactions
Auth	Authorization: Bearer {api_key}
Request body	{ tourist_id: string, amount_tzs: integer, bundle_type: string, transaction_type: 'first_purchase' 'topup', transaction_reference: string }
What it does	1. Validate api_key → find business. 2. Look up referral by tourist_id + business_id. 3. If no referral: return success with commission 0. 4. Calculate commission: amount_tzs × business.commission_rate. 5. Calculate platform fee (e.g. 1% of amount). 6. Check business.wallet_balance >= commission. 7. If sufficient: deduct from wallet, credit partner, create transaction row with status 'paid', create notification for partner. 8. If insufficient: create transaction row with status 'pending', notify business and partner. 9. Update referral totals. 10. Return result.
Success — paid 200	{ success: true, commission_tzs: integer, platform_fee_tzs: integer, commission_status: 'paid' }
Success — pending 200	{ success: true, commission_tzs: integer, commission_status: 'pending', reason: 'insufficient_wallet_balance' }
No referral 200	{ success: true, commission_tzs: 0, message: 'No referral linked to this tourist' }
Failed auth 401	{ success: false, error: 'Invalid API key' }

8. Seed Data — What to Put in the Database for the Demo

The demo must have realistic, believable data when The Travela walks in. Seed all of this before the meeting.

Demo accounts (login credentials to prepare)

Account	Email	Password	Role	What they see
The Travela	demo@thetravela.com	Demo2026!	business	Full business dashboard with all partners and data
Serena Hotel	serena@demo.pazo.co.tz	Demo2026!	institution	Institution dashboard with 3 months of payout history
Amina Hassan	amina@demo.pazo.co.tz	Demo2026!	agent	Agent dashboard with earnings and notifications
Pazo Admin	admin@pazo.co.tz	Admin2026!	admin	Full admin view of all data

Dummy data to seed

- 3 institution partners for The Travela: Serena Hotel Dar es Salaam (SERENA24), Kilimanjaro International Airport (KILIAIR), Tanzania Tourism Board (TZBRD)
- 2 individual agent partners: Amina Hassan (AMINA07), David Kipanga (DAVID55)
- For each partner: at least 3 months of transaction history. Use realistic TZS amounts (30,840 for \$12 bundle, 61,680 for \$24 bundle, 102,800 for \$40 bundle).
- For Serena Hotel: 3 monthly payouts already paid (June, July) and one upcoming (August 1st).
- For Amina Hassan: 20+ commission transactions across the last 30 days. Mix of first purchases and top-ups.
- For The Travela wallet: balance of TZS 5,499,800. Show several top-ups and commission deductions in wallet history.
- For notifications: seed 10 notifications for Amina and 5 for Serena Hotel — all commission received messages, no tourist names.

9. What Comes After the Demo

Once The Travela confirms they want to proceed, here is the order of what gets added on top of the demo build. The developer should know this so they build the demo in a way that is easy to extend.

Next feature	Builds on what	Priority
AzamPay integration — actual mobile money disbursement to agents	Transaction engine already built — just add AzamPay API call on 'paid' status	First after demo
Partner self-signup — agents sign up themselves via a link	Auth already built — add a public signup page with role selection	First after demo
Real wallet top-up for businesses	Wallet table already built — add a top-up flow (bank transfer confirmation by admin)	First after demo
Monthly payout automation for institutions	Transaction history already built — add a cron job that runs on 1st of month	First after demo
SMS notifications	Notification table already built — add SMS API call alongside in-app	Second batch
SME businesses and referral code POS flow	Business and partner models already built — add the POS screen and cash/mobile money flows	Second batch
Creator features (content submission, portfolio)	Agent model extended — creators are agents with content features added	Second batch
Mobile app (React Native)	All API endpoints already built — mobile app is a new frontend against the same API	Third batch

10. Summary — What the Developer Needs to Know

Item	Detail
Stack	Next.js (React) + Node.js + PostgreSQL + Tailwind CSS
Timeline to working demo	4 days following the phase order in Section 4
Total screens to build	16 screens across 4 dashboards (listed in Section 5)
Database tables	6 tables (listed in Section 6)
API endpoints	2 endpoints (listed in Section 7)
Demo accounts	4 accounts with seed data (listed in Section 8)
What NOT to build	POS, mobile app, AzamPay, SMS, content/portfolio features, subscriptions
Privacy rule	Tourist names never shown to agents or institutions — only amounts and dates
The TraveLa's developer needs	API key for testing, endpoint URLs, request and response format from Section 7

The goal for the demo

The Travela should be able to log in and see their partner programme working.

Serena Hotel should be able to log in and see their commissions accumulating and their payout history.

Amina Hassan should be able to log in and see her referral code, QR code, and earnings — all without a single tourist name visible.

The Pazo admin should be able to log in and see the full picture.

That is the demo. Nothing more is needed on day one.
